A token is an object or symbol that is exchanged for goods or services. Tokens, in the form of clay coins, first appeared in human history in the transition from nomadic hunter-gatherer societies to agricultural societies, and the expansion from simple barter economies to more complex economies (Schmandt-Besserat, 1992). Since that time, token systems, in one form or another, have provided the ...

Environmental information plays an important role in deep reinforcement learning (DRL). However, many algorithms do not pay much attention to environmental information. In multi-agent reinforcement learning decision-making, because agents need to make decisions combined with the information of other agents in the environment, this makes the environmental information more important.

As we noted above, operant conditioning outlines four ways of influencing behavior based on the consequence and the desired result: Positive punishment: something is "added" to the mix that makes the behavior less likely to continue or reoccur (i.e., an unpleasant consequence is introduced to the subject to discourage their behavior).; Positive reinforcement: something is added to the mix ...

INTRODUCTION. The term operant conditioning was coined by B. F. Skinner in 1937 in the context of reflex physiology, to differentiate what he was interested in—behavior that affects the environment—from the reflex-related subject matter of the Pavlovians. The term was novel, but its referent was not entirely new. Operant behavior, though defined by Skinner as behavior "controlled by ...

The path tracking control system is a crucial component for autonomous vehicles; it is challenging to realize accurate tracking control when approaching a wide range of uncertain situations and dynamic environments, particularly when such control must perform as well as, or better than, human drivers. While many methods provide state-of-the-art tracking performance, they tend to emphasize ...

If reinforcement is given without a proper plan or in an offhand manner then the effect of it might decrease. Therefore, it is important that reinforcement is scheduled, be it positive or negative. To plan reinforcement two important dimensions have to be considered, viz., Time, and Responses. 1.

Key concepts of behaviorism comprise the stimulus - response (S-R) equation, the classical and operant conditioning, and the reinforcement and punishment notions. The method used to analyze behavior is the lab experiment which gave the possibility to manipulate the independent variable in order to study the dependent variable.
