Onobrychis viciifolia, also known as *O. sativa* or common sainfoin has been an important forage legume in temperate regions until the 1950s. During the Green Revolution it was replaced by high yielding alfalfa and clover species. Due to its anthelmintic properties the common sainfoin is a natural alternative to drugs to control nematode parasitism in the guts of small ruminants.

Onobrychis viciifolia - Wikipedia

Photosensitisation is inflammation of the skin, and occasionally the conjunctiva and cornea of the eye. Primary photosensitisation can arise as a result of eating a range of plants that contain photosensitising substances. Secondary photosensitisation occurs as a result of liver damage. Prompt treatment by removing stock from the source of the toxin, keeping them out of direct sunlight and ...
