Public key cryptosystem is one which involves two separate keys for encryption and decryption. Each user participating in the communication has to generate two keys, one is to be kept secret (private key) and one is to be made public (public key). Public key cryptosystem can achieve both confidentiality and authenticity.

Applications of public key cryptography. The three main categories of applications of public key cryptosystems are: encryption / decryption: the sender encrypts a message with the recipient's public key, which the recipient can decrypt using their private key; digital signatures: the sender signs a message with their private key, so the recipient can use the senders public key to verify that ...

Applications of Public Key Cryptography | COMP38411

The most obvious application of a public key encryption system is in encrypting communication to provide confidentiality – a message that a sender encrypts using the recipient's public key can be decrypted only by the recipient's paired private key. Another application in public

Public-key cryptography - Wikipedia

Business Applications. The main business applications for public-key cryptography are: Digital signatures - content is digitally signed with an individual's private key and is verified by the individual's public key. Encryption - content is encrypted using an individual's public key and can only be decrypted with the individual's private key. Security Benefits of Digital Signatures.
