Differential. When a Stirling engine has a Low Temperature Differential it means that it can run when the warm side is not much warmer than the cool side. Put another way, the difference between the warm and cool side is very small. Some LTD engines can run on as little as $1/2^{\circ}$ C.

A Low-temperature
Difference (LTD)
engine is sort of a
variation of the
Gamma Type Stirling
engine with the power
cylinder usually moved
on top of the displacer
cylinder. But because
they are designed to
run on small
temperature
differences, they are
shorter and a lot wider
than flame heated
engines.

Stirling Engine Solar Models - Kits, Ready to Run and DIY

Very low-power engines have been built that run on a temperature difference of as little as 0.5 K. A displacer type stirling engine has one piston and one displacer. A temperature difference is required between the top and bottom of the large cylinder to run the engine.
